## Анотація

**Background.** The long road from pure type systems of AUTOMATH by de Bruijn to type checkers with homotopical core was made. This article touches only the formal Martin-Löf Type Theory core type system with  $\Pi$  and  $\Sigma$  types (that correspond to  $\forall$  and  $\exists$  quantifiers for mathematical reasoning) and identity type (MLTT-75). Expressing the MLTT embedding in a host type checker for a long time was inaccessible due to the non-derivability of the J eliminator in pure functions. This was recently made possible by cubical type theory and cubical type checker.

**Objective.** Select the type system as a part of conceptual model of theorem proving system that is able to derive the J eliminator and its theorems based on the latest research in cubical type systems. The goal of this article is to demonstrate the formal embedding of MLTT-75 into **Per** with constructive proofs of the complete set of inference rules including J eliminator.

**Methods.** As types are formulated using 5 types of rules (formation, intro, elimination, computation, uniqueness) according to MLTT we constructed aliases for the host language primitives and used the cubical type checker to prove that it has the realization of MLTT-75.

**Results.** This work leads to several results: 1) **Per** — a special embedded version of type theory with infinite number of universes and Path type suitable for HoTT purposes without uniqueness rule of equality type; 2) The actual embedding of MLTT with syntax implying universe polymorphism and cubical primitives in **Per**; 3) The different interpretations of types were given: set-theoretical, groupoid, homotopical; 4) Internalization could be seen as an ultimate test sample for type checker as intro-elimination fusion resides in beta-eta rules, so by proving them, we prove properties of the host type checker.

**Conclusion.** We should note that this is an entrance to the internalization technique, and after formal MLTT embedding, we could go through inductive types up to embedding of CW-complexes as the indexed gluing of the higher inductive types. This means the implementation of a wide spectrum of math theories inside HoTT up to algebraic topology.

**Keywords:** Martin-Löf Type Theory, Cubical Type Theory.

## Introduction

Each language implementation needs to be checked. The one of possible test cases for type checkers is the direct embedding of type theory model into the language of type checker. As types in Martin-Löf Type Theory [7, 8] are formulated using 5 types of rules (formation, introduction, elimination, computation, uniqueness), we construct aliases for host language primitives and use type checker to prove that it is MLTT-75. This could be seen as ultimate test sample for type checker as intro-elimination fusion resides in beta-eta rules, so by proving them we prove properties of the host type checker.

Also this issue opens a series of articles dedicated to formalization in cubical type theory the foundations of mathematics. This issue is dedicated to MLTT modeling and its verification. Also as many may not be familiar with  $\Pi$  and  $\Sigma$  types, this issue presents different interpretation of MLTT types.

This test is fully made possible only after 2017 when new constructive HoTT [12] prover cubicaltt<sup>1</sup> prover was presented [9].

## Problem Statement

The formal initial problem was to create a full self-contained MLTT internalization in the host typechecker, where all theorems are being checked constructively. This task involves a modern techniques in type theory, namely cubical type theories. By following most advaced theories apply this results for building minimal type checker that is able to derive J and the whole MLTT theorems constructively. This leads us to the compact MLTT core yet compatible with future possible homotopy extensions.

---

<sup>1</sup><http://github.com/mortberg/cubicaltt>

## Per Language Syntax

The BNF notation of type checker language used in code samples consists of: i) telescopes (contexts or sigma chains) and definitions; ii) pure dependent type theory syntax; iii) inductive data definitions (sum chains) and split eliminator; iv) cubical face system; v) module system. It is slightly based on cubicaltt.

```

sys := [ sides ]
side := (id=0)→exp + (id=1)→exp
f1 := f1 /\ f2
f2 := -f2 + id + 0 + 1
form := form \/ f1 + f1 + f2
sides := #empty + cos + side
cos := side , side + side , cos
id := #list #nat
ids := #list id
mod := module id where imps dec
imps := #list imp
imp := import id
brs := #empty + cobrs
cobrs := | br brs
br := ids → exp + ids @ ids → exp
tel := #empty + cotel
dec := #empty + codec
cotel := (exp:exp) tel
codec := def dec
sum := #empty + id tel + id tel | sum
def := data id tel=sum + id tel:exp=exp
      + id tel : exp where def
app := exp exp
exp := cotel * exp + cotel → exp
      + exp → exp + (exp) + id
      + (exp,exp) + \cotele → exp
      + split cobrs + exp .1
      + exp .2 + ⟨ ids ⟩ exp
      + exp @ form + app + comp exp sys

```

Here := (definition), + (disjoint sum), #empty, #nat, #list are parts of BNF language and |, :, \*, ⟨ ⟩, ( ), =, \, /, -, →, 0, 1, @, [ ], **module**, **import**, **data**, **split**, **where**, **comp**, **.1**, **.2**, and , are terminals of type checker language. This language includes inductive types, higher inductive types and gluenig operations needed for both, the constructive homotopy type theory and univalence. All these concepts as a part of the languages will be described in the upcoming Issues II–V.

# 1 Martin-Löf Type Theory

Martin-Löf Type Theory MLTT-80 contains  $\Pi$ ,  $\Sigma$ , Id, W, 0, 1, 2 types.

Any new type in MLTT presented with set of 5 rules: i) formation rules, the signature of type; ii) the set of constructors which produce the elements of formation rule signature; iii) the dependent eliminator or induction principle for this type; iv) the beta-equality or computational rule; v) the eta-equality or uniqueness principle.  $\Pi$ ,  $\Sigma$ , and Path types will be given shortly. This interpretation or rather way of modeling is MLTT specific.

The most interesting are Id types. Id types were added in MLTT-75 [8] while original MLTT-72 with only  $\Pi$  and  $\Sigma$  was introduced in [7]. Predicative Universe Hierarchy was added in [6]. While original MLTT-75 contains Id types that preserve uniqueness of identity proofs (UIP) or eta-rule of Id type, HoTT refutes UIP (eta rule doesn't hold) and introduces univalent heterogeneous Path equality [4].

Path types are essential to prove computation and uniqueness rules for all types (needed for building signature and terms), so we will be able to prove all the MLTT rules as a whole.

## 1.1 Interpretations

In contexts you can bind to variables (through de Bruijn indexes or string names): i) indexed universes; ii) built-in types; iii) user constructed types, and ask questions about type derivability, type checking and code extraction. This system defines the core type checker within its language.

By using this languages it is possible to encode different interpretations of type theory itself and its syntax by construction. Usually the issues will refer to following interpretations: i) type-theoretical; ii) categorical; iii) set-theoretical; iv) homotopical; v) fibrational or geometrical.

### 1.1.1 Logical or Type-theoretical interpretation

According to type theoretical interpretation of MLTT for any type should be provided 5 formal inference rules: i) formation; ii) introduction; iii) dependent elimination principle; iv) beta rule or computational rule; v) eta rule or uniqueness rule. The last one could be exceptional for Path types. The formal representation of all rules of MLTT are given according to type-theoretical interpretation as a final result in this Issue I. It was proven that classical Logic could be embedded into intuitionistic propositional logic (IPL) which is directly embedded into MLTT.

Logical and type-theoretical interpretations could be distinguished. Also set-theoretical interpretation is not presented in the Table.

### 1.1.2 Categorical or Topos-theoretical interpretation

Categorical interpretation [2] is a modeling through categories and functors. First category is defined as objects, morphisms and their properties, then we define

Табл. 1: \*

**Table.** Interpretations correspond to mathematical theories

Type Theory	Logic	Category Theory	Homotopy Theory
A type	class	object	space
isProp A	proposition	(-1)-truncated object	space
a:A program	proof	generalized element	point
$B(x)$	predicate	indexed object	fibration
$b(x) : B(x)$	conditional proof	indexed elements	section
$\emptyset$	$\perp$ false	initial object	empty space
$\mathbf{1}$	$\top$ true	terminal object	singleton
$A + B$	$A \vee B$ disjunction	coproduct	coproduct space
$A \times B$	$A \wedge B$ conjunction	product	product space
$A \rightarrow B$	$A \Rightarrow B$	internal hom	function space
$\sum x : A, B(x)$	$\exists_{x:A} B(x)$	dependent sum	total space
$\prod x : A, B(x)$	$\forall_{x:A} B(x)$	dependent product	space of sections
$\mathbf{Path}_A$	equivalence $=_A$	path space object	path space $A^I$
quotient	equivalence class	quotient	quotient
W-type	induction	colimit	complex
type of types	universe	object classifier	universe
quantum circuit	proof net	string diagram	

functors, etc. In particular, as an example, according to categorical interpretation  $\Pi$  and  $\Sigma$  types of MLTT are presented as adjoint functors, and forms itself a locally closed cartesian category, which will be given a intermediate result in **Issue VIII: Topos Theory**. In some sense we include here topos-theoretical interpretations, with presheaf model of type theory as example (in this case fibrations are constructs as functors, categorically).

### 1.1.3 Homotopical interpretation

In classical MLTT uniqueness rule of Id type do holds strictly. In Homotopical interpretation of MLTT we need to allow a path space as Path type where uniqueness rule doesn't hold. Groupoid interpretation of Path equality that doesn't hold UIP generally was given in 1996 by Martin Hofmann and Thomas Streicher [4].

When objects are defined as fibrations, or dependent products, or indexed-objects this leads to fibrational semantics and geometric sheaf interpretation. Several definition of fiber bundles and trivial fiber bundle as direct isomorphisms of  $\Pi$  types is given here as theorem. As fibrations study in homotopical interpretation, geometric interpretation could be treated as homotopical.

### 1.1.4 Set-theoretical interpretation

Set-theoretical interpretations could replace first-order logic, but could not allow higher equalities, as long as inductive types to be embedded directly. Set is modelled in type theory according to homotopical interpretation as n-type.

## 1.2 Types

MLTT-80 could be reduced to  $\Pi$ ,  $\Sigma$ , Path types (MLTT-75) omitting polynomial functors  $W$  modeled by F-algebras and their terminators: 0, 1, 2 types. In this issue  $\Pi$ ,  $\Sigma$ , Path are given as a core of MLTT-75.

### 1.2.1 $\Pi$ -type

$\Pi$  is a dependent product type, the generalization of functions. As a function it can serve the wide range of mathematical constructions as its domain and codomain, which are in general: objects, types, or spaces; and could have as its instance: sets, functions, polynomial functors, infinitesimals,  $\infty$ -groupoids, topological  $\infty$ -groupoid, CW-complexes, categories, languages, etc.

At this light there could be many interpretation of  $\Pi$  types from different areas of mathematics. We give here three: i) logical interpretation of  $\Pi$  as  $\forall$  quantifier from higher order logic that forms a ground of type theory; ii) geometric interpretation of  $\Pi$  as fiber bundle; iii) categorical interpretation of functions as functors.

#### Type-theoretical interpretation

As a logical system dependent type theory could correspond to higher order logic. However here only type-theoretical model is given completely.

**Definition 1.** ( $\Pi$ -Formation).

$$(x : A) \rightarrow B(x) =_{def} \prod_{x:A} B(x) : U.$$

$$\Pi (A : U) (B : A \rightarrow U) : U = (x : A) \rightarrow B x$$

**Definition 2.** ( $\Pi$ -Introduction).

$$\backslash (x : A) \rightarrow b =_{def} \prod_{A:U} \prod_{B:A \rightarrow U} \prod_{a:A} \prod_{b:B(a)} \lambda x.b : \prod_{y:A} B(y).$$

$$\begin{aligned} \text{lambda } (A B : U) (b : B) : A \rightarrow B &= \backslash (x : A) \rightarrow b \\ \text{lam } (A:U) (B : A \rightarrow U) (a:A) (b:B a) \\ &: A \rightarrow B a = \backslash (x : A) \rightarrow b \end{aligned}$$

**Definition 3.** ( $\Pi$ -Elimination).

$$f a =_{def} \prod_{A:U} \prod_{B:A \rightarrow U} \prod_{a:A} \prod_{f:\prod_{x:A} B(x)} f(a) : B(a).$$

$\text{apply } (A \ B : U) \ (f : A \multimap B) \ (a : A) : B = f \ a$   
 $\text{app } (A : U) \ (B : A \multimap U) \ (a : A)$   
 $\quad (f : A \multimap B \ a) : B \ a = f \ a$

**Theorem 1.** (II-Computation).

$$f(a) =_{B(a)} (\lambda(x : A) \rightarrow f(a))(a).$$

$\text{Beta } (A : U) \ (B : A \multimap U) \ (a : A) \ (f : A \multimap B \ a)$   
 $\quad : \text{Path } (B \ a) \ (\text{app } A \ B \ a \ (\text{lam } A \ B \ a \ (f \ a)))$   
 $\quad (f \ a)$

**Theorem 2.** (II-Uniqueness).

$$f =_{(x:A) \rightarrow B(a)} (\lambda(y : A) \rightarrow f(y)).$$

$\text{Eta } (A : U) \ (B : A \multimap U) \ (a : A) \ (f : A \multimap B \ a)$   
 $\quad : \text{Path } (A \multimap B \ a) \ f \ (\lambda(x : A) \multimap f \ x)$

### Categorical interpretation

The adjoints  $\Pi$  and  $\Sigma$  is not the only adjoints could be presented in type system. Axiomatic cohesions could contain a set of adjoint pairs as a core type checker operations.

**Definition 4.** (Dependent Product). The dependent product along morphism  $g : B \rightarrow A$  in category  $C$  is the right adjoint  $\Pi_g : C_{/B} \rightarrow C_{/A}$  of the base change functor.

**Definition 5.** (Space of Sections). Let  $\mathbf{H}$  be a  $(\infty, 1)$ -topos, and let  $E \rightarrow B : \mathbf{H}_{/B}$  a bundle in  $\mathbf{H}$ , object in the slice topos. Then the space of sections  $\Gamma_\Sigma(E)$  of this bundle is the Dependent Product:

$$\Gamma_\Sigma(E) = \Pi_\Sigma(E) \in \mathbf{H}.$$

**Theorem 3.** (HomSet). If codomain is set then space of sections is a set.

$\text{setFun } (A \ B : U) \ (\_ : \text{isSet } B)$   
 $\quad : \text{isSet } (A \multimap B)$

**Theorem 4.** (Contractability). If domain and codomain is contractible then the space of sections is contractible.

$\text{piIsContr } (A : U) \ (B : A \multimap U) \ (u : \text{isContr } A)$   
 $\quad (q : (x : A) \multimap \text{isContr } (B \ x))$   
 $\quad : \text{isContr } (\Pi \ A \ B)$

**Definition 6.** (Section). A section of morphism  $f : A \rightarrow B$  in some category is the morphism  $g : B \rightarrow A$  such that  $f \circ g : B \xrightarrow{g} A \xrightarrow{f} B$  equals the identity morphism on  $B$ .

## Homotopical interpretation

Geometrically,  $\Pi$  type is a space of sections, while the dependent codomain is a space of fibrations. Lambda functions are sections or points in these spaces, while the function result is a fibration.  $\Pi$  type also represents the cartesian family of sets, generalizing the cartesian product of sets.

**Definition 7.** (Fiber). The fiber of the map  $p : E \rightarrow B$  in a point  $y : B$  is all points  $x : E$  such that  $p(x) = y$ .

**Definition 8.** (Fiber Bundle). The fiber bundle  $F \rightarrow E \xrightarrow{p} B$  on a total space  $E$  with fiber layer  $F$  and base  $B$  is a structure  $(F, E, p, B)$  where  $p : E \rightarrow B$  is a surjective map with following property: for any point  $y : B$  exists a neighborhood  $U_b$  for which a homeomorphism  $f : p^{-1}(U_b) \rightarrow U_b \times F$  making the following diagram commute.

$$\begin{array}{ccc} p^{-1}(U_b) & \xrightarrow{f} & U_b \times F \\ p \downarrow & \swarrow pr_1 & \\ U_b & & \end{array}$$

**Definition 9.** (Cartesian Product of Family over B). Is a set  $F$  of sections of the bundle with elimination map  $app : F \times B \rightarrow E$  such that

$$F \times B \xrightarrow{app} E \xrightarrow{pr_1} B \quad (1)$$

$pr_1$  is a product projection, so  $pr_1, app$  are morphisms of slice category  $Set/B$ . The universal mapping property of  $F$ : for all  $A$  and morphism  $A \times B \rightarrow E$  in  $Set/B$  exists unique map  $A \rightarrow F$  such that everything commute. So a category with all dependent products is necessarily a category with all pullbacks.

**Definition 10.** (Trivial Fiber Bundle). When total space  $E$  is cartesian product  $\Sigma(B, F)$  and  $p = pr_1$  then such bundle is called trivial  $(F, \Sigma(B, F), pr_1, B)$ .

**Theorem 5.** (Functions Preserve Paths). For a function  $f : (x : A) \rightarrow B(x)$  there is an  $ap_f : x =_A y \rightarrow f(x) =_{B(x)} f(y)$ . This is called application of  $f$  to path or congruence property (for non-dependent case — *cong* function). This property behaves functorially as if paths are groupoid morphisms and types are objects.

**Theorem 6.** (Trivial Fiber equals Family of Sets). Inverse image (fiber) of fiber bundle  $(F, B * F, pr_1, B)$  in point  $y : B$  equals  $F(y)$ .

FiberPi (B: U) (F: B  $\rightarrow$  U) (y: B)  
 : Path U (fiber (Sigma B F) B (pi1 B F) y)  
 (F y)

**Theorem 7.** (Homotopy Equivalence). If fiber space is set for all base, and there are two functions  $f, g : (x : A) \rightarrow B(x)$  and two homotopies between them, then these homotopies are equal.

```

setPi (A: U) (B: A → U)
  (h: (x: A) → isSet (B x)) (f g: Pi A B)
  (p q: Path (Pi A B) f g)
  : Path (Path (Pi A B) f g) p q

```

Note that we will not be able to prove this theorem until **Issue III: Homotopy Type Theory** because bi-invertible iso type will be announced there.

### 1.2.2 $\Sigma$ -type

$\Sigma$  is a dependent sum type, the generalization of products.  $\Sigma$  type is a total space of fibration. Element of total space is formed as a pair of basepoint and fibration.

#### Type-theoretical interpretation

**Definition 11.** ( $\Sigma$ -Formation).

```

Sigma (A : U) (B : A → U)
  : U = (x : A) * B x

```

**Definition 12.** ( $\Sigma$ -Introduction).

```

dpair (A: U) (B: A → U) (a: A) (b: B a)
  : Sigma A B = (a, b)

```

**Definition 13.** ( $\Sigma$ -Elimination).

```

pr1 (A: U) (B: A → U)
  (x: Sigma A B): A = x.1

```

```

pr2 (A: U) (B: A → U)
  (x: Sigma A B): B (pr1 A B x) = x.2

```

```

sigInd (A: U) (B: A → U)
  (C: Sigma A B → U)
  (g: (a: A) (b: B a) → C (a, b))
  (p: Sigma A B) : C p = g p.1 p.2

```

**Theorem 8.** ( $\Sigma$ -Computation).

```

Beta1 (A: U) (B: A → U)
  (a:A) (b: B a)
  : Equ A a (pr1 A B (a, b))

```

Beta2 (A: U) (B: A  $\rightarrow$  U)  
 (a: A) (b: B a)  
 : Equ (B a) b (pr2 A B (a, b))

**Theorem 9.** ( $\Sigma$ -Uniqueness).

Eta2 (A: U) (B: A  $\rightarrow$  U) (p: Sigma A B)  
 : Equ (Sigma A B) p (pr1 A B p, pr2 A B p)

### Categorical interpretation

**Definition 14.** (Dependent Sum). The dependent sum along the morphism  $f: A \rightarrow B$  in category  $\mathcal{C}$  is the left adjoint  $\Sigma_f: \mathcal{C}_{/A} \rightarrow \mathcal{C}_{/B}$  of the base change functor.

### Set-theoretical interpretation

**Theorem 10.** (Axiom of Choice). If for all  $x: A$  there is  $y: B$  such that  $R(x, y)$ , then there is a function  $f: A \rightarrow B$  such that for all  $x: A$  there is a witness of  $R(x, f(x))$ .

ac (A B: U) (R: A  $\rightarrow$  B  $\rightarrow$  U)  
 : (p: (x:A)  $\rightarrow$  (y:B)\*(R x y))  
 $\rightarrow$  (f:A $\rightarrow$ B) \* ((x:A) $\rightarrow$ R(x)(f x))

**Theorem 11.** (Total). If fiber over base implies another fiber over the same base then we can construct total space of section over that base with another fiber.

total (A:U) (B C: A  $\rightarrow$  U)  
 (f: (x:A)  $\rightarrow$  B x  $\rightarrow$  C x) (w: Sigma A B)  
 : Sigma A C = (w.1, f (w.1) (w.2))

**Theorem 12.** ( $\Sigma$ -Contractability). If the fiber is set then the  $\Sigma$  is set.

setSig (A:U) (B: A  $\rightarrow$  U) (sA: isSet A)  
 (sB : (x:A)  $\rightarrow$  isSet (B x))  
 : isSet (Sigma A B)

**Theorem 13.** (Path Between Sigmas). Path between two sigmas  $t, u: \Sigma(A, B)$  could be decomposed to sigma of two paths  $p: t_1 =_A u_1$  and  $(t_2 =_{B(p@i)} u_2)$ .

pathSig (A:U) (B : A  $\rightarrow$  U) (t u : Sigma A B)  
 : Path U (Path (Sigma A B) t u)  
 ((p: Path A t.1 u.1)  
 \* PathP (<i>B(p@i)) t.2 u.2)

### 1.2.3 Path-type

The Path identity type defines a Path space with elements and values. Elements of that space are functions from interval  $[0, 1]$  to a values of that path space. This ctt file reflects <sup>2</sup>CCHM cubicaltt model with connections. For <sup>3</sup>ABCFHL yacctt model with variables please refer to ytt file. You may also want to read <sup>4</sup>BCH, <sup>5</sup>AFH. There is a <sup>6</sup>PO paper about CCHM axiomatic in a topos.

#### Cubical interpretation

Cubical interpretation was first given by Simon Huber [5] and later was written first constructive type checker in the world by Anders Mörtberg [9].

**Definition 15.** (Path Formation).

```
Hetero (A B: U)(a: A)(b: B)(P: Path U A B)
  : U = PathP P a b
Path (A: U) (a b: A)
  : U = PathP (<i>A) a b
```

**Definition 16.** (Path Reflexivity). Returns an element of reflexivity path space for a given value of the type. The inhabitant of that path space is the lambda on the homotopy interval  $[0, 1]$  that returns a constant value  $a$ . Written in syntax as  $|<i>a|$  which equals to  $\lambda (i : I) \rightarrow a$ .

```
refl (A: U) (a: A) : Path A a a
```

**Definition 17.** (Path Application). You can apply face to path.

```
app1 (A: U)(a b:A)(p:Path A a b):A=p@0
app2 (A: U)(a b:A)(p:Path A a b):A=p@1
```

**Definition 18.** (Path Composition). Composition operation allows to build a new path by given to paths in a connected point.

$$\begin{array}{ccc}
 & a & \xrightarrow{\text{comp}} c \\
 \lambda(i : I) \rightarrow a \uparrow & & \uparrow q \\
 & a & \xrightarrow{p@i} b
 \end{array}$$

  (b: B a) (p: Path A a x)
  : Path (B a) (f a) (f x)

```

**Theorem 16.** (Transport). Transports a value of the domain type to the value of the codomain type by a given path element of the path space between domain and codomain types. Defined as path composition with  $|||$  of a over a path  $p - |comp p a |||$ .

```

trans (A B: U) (p: Path U A B) (a: A) : B

```

### Type-theoretical interpretation

**Definition 20.** (Singleton).

$\text{singl } (A: U) (a: A): U = (x: A) * \text{Path } A \ a \ x$

**Theorem 17.** (Singleton Instance).

$\text{eta } (A: U) (a: A): \text{singl } A \ a = (a, \text{refl } A \ a)$

**Theorem 18.** (Singleton Contractability).

$\text{contr } (A: U) (a \ b: A) (p: \text{Path } A \ a \ b)$   
:  $\text{Path } (\text{singl } A \ a) (\text{eta } A \ a) (b, p)$   
 $= \langle i \rangle (p @ i, \langle j \rangle p @ i / \setminus j)$

**Theorem 19.** (Path Elimination, Paulin-Mohring). J is formulated in a form of Paulin-Mohring and implemented using two facts that singleton are contractible and dependent function transport.

$J (A: U) (a \ b: A)$   
( $P: \text{singl } A \ a \rightarrow U$ )  
( $u: P (a, \text{refl } A \ a)$ )  
( $p: \text{Path } A \ a \ b$ ) :  $P (b, p)$

**Theorem 20.** (Path Elimination, HoTT). J from HoTT book.

$J (A: U) (a \ b: A)$   
( $C: (x: A) \rightarrow \text{Path } A \ a \ x \rightarrow U$ )  
( $d: C \ a \ (\text{refl } A \ a)$ )  
( $p: \text{Path } A \ a \ b$ ) :  $C \ b \ p$

**Theorem 21.** (Path Computation).

$\text{trans\_comp } (A: U) (a: A)$   
:  $\text{Path } A \ a \ (\text{trans } A \ A \ (\langle \_ \rangle A) \ a)$   
 $= \text{fill } (\langle i \rangle A) \ a \ []$   
 $\text{subst\_comp } (A: U) (P: A \rightarrow U) (a: A) (e: P \ a)$   
:  $\text{Path } (P \ a) \ e \ (\text{subst } A \ P \ a \ a \ (\text{refl } A \ a) \ e)$   
 $= \text{trans\_comp } (P \ a) \ e$   
 $J\_comp (A: U) (a: A) (C: (x: A)$   
 $\rightarrow \text{Path } A \ a \ x \rightarrow U) (d: C \ a \ (\text{refl } A \ a))$   
:  $\text{Path } (C \ a \ (\text{refl } A \ a)) \ d$   
( $J \ A \ a \ C \ d \ a \ (\text{refl } A \ a)$ )  
 $= \text{subst\_comp } (\text{singl } A \ a) \ T \ (\text{eta } A \ a) \ d$   
where  $T (z: \text{singl } A \ a)$   
:  $U = C \ a \ (z.1) \ (z.2)$

Note that Path type has no Eta rule due to groupoid interpretation.

### 1.2.4 Groupoid interpretation

The groupoid interpretation of type theory is well known article by Martin Hofmann and Thomas Streicher, more specific interpretation of identity type as infinity groupoid.

## 1.3 Contexts

Speaking of type checker execution, we introduce context or dictionary with types and terms, from which we can derive typed variables. This chain could be implemented as nested sigma types (due to R.A.G.Seely) or list types (due to Voevodsky). Categorically dependent type theory is built upon categories of contexts.

**Definition 21.** (Empty Context).

$$\gamma_0 : \Gamma =_{def} \star.$$

**Definition 22.** (Context Comprehension).

$$\Gamma ; A =_{def} \sum_{\gamma:\Gamma} A(\gamma).$$

**Definition 23.** (Context Derivability).

$$\Gamma \vdash A =_{def} \prod_{\gamma:\Gamma} A(\gamma).$$

## 1.4 Universes

This introduction is a bit wild strives to be simple yet precise. As we defined a language BNF we could define a language AST by using inductive types which is yet to be defined in **Issue II: Inductive Types and Models**. This SAR notation is due Barendregt.

**Definition 24.** (Terms). Point in initial object of language AST inductive definition is called a term. If type theory or language is defined as an inductive type (AST) then the term is defined as its instance.

**Definition 25.** (Sorts). N-indexed set of universes  $U_{n \in \mathbb{N}}$ . Could have any number of elements which defines different type systems. All built-in types as long as user defined types are landed usually by default in  $U_0$  universe. Sorts represented in type checker as a separate constructor.

**Definition 26.** (Axioms). The inclusion rules  $U_i : U_j, i, j \in \mathbb{N}$ , that define which universe is element of another given universe. You may attach any rules that joins  $i, j$  in some way. Axioms with sorts define universe hierarchy.

**Definition 27.** (Rules). The set of landings  $U_i \rightarrow U_j : U_{\lambda(i,j), i,j \in \mathbb{N}}$ , where  $\lambda : \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$ . These rules define term dependence or how we land (in which universe) formation rules in definitions.

**Definition 28.** (Predicative hierarchy). If  $\lambda$  in Rules is an uncurried function  $\max : \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$  then such universe hierarchy is called predicative.

**Definition 29.** (Impredicative hierarchy). If  $\lambda$  in Rules is a second projection of a tuple  $\text{snd} : \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N}$  then such universe hierarchy is called impredicative.

**Definition 30.** (Definitional Equality). For any  $U_i, i \in \mathbb{N}$  there is defined an equality between its members and between its instances. For all  $x, y \in A$ , there is defined a  $x=y$ . Definitional equality compares normalized term instances.

**Definition 31.** (SAR). The universum space is configured with a triple of: i) sorts, a set of universes  $U_{n \in \mathbb{N}}$  indexed over set  $\mathbb{N}$ ; ii) axioms, a set of inclusions  $U_i : U_j, i, j \in \mathbb{N}$ ; iii) rules of term dependence universe landing, a set of landings  $U_i \rightarrow U_j : U_{\lambda(i,j)}, i, j \in \mathbb{N}$ , where  $\lambda$  could be function *max* (predicative) or *snd* (impredicative).

**Example 1.** (CoC).  $\text{SAR} = \{\{\star, \square\}, \{\star : \square\}, \{i \rightarrow j : j; i, j \in \{\star, \square\}\}$ . Terms live in universe  $\star$ , and types live in universe  $\square$ . In CoC  $\lambda = \text{snd}$ .

**Example 2.**  $(\text{PTS}^\infty, \text{MLTT}^\infty)$ .

$\text{SAR} = \{U_{i \in \mathbb{N}}, U_i : U_{j; i < j; i, j \in \mathbb{N}}, U_i \rightarrow U_j : U_{\lambda(i,j); i, j \in \mathbb{N}}\}$ . Where  $U_i$  is a universe of  $i$ -level or  $i$ -category in categorical interpretation. The working prototype of  $\text{PTS}^\infty$  is given in **Addendum I: Pure Type System for Erlang** [11].

## 1.5 MLTT-75

Here is given formal model of type-theoretical interpretation of Martin-Löf Type Theory. It combines 4 Path rules (no eta), 5  $\Pi$  rules, and 6  $\Sigma$  rules (two elims). The proof is provided by direct embedding (internalizing) the model into the model of type checker which is even more powerful.

**Definition 32.** (MLTT-75). The MLTT as a Type is defined by taking all rules for  $\Pi$ ,  $\Sigma$  and Path types into one  $\Sigma$  telescope or context.

```

MLTT (A: U): U
= (Pi_Former: (A → U) → U)
* (Pi_Intro: (B: A → U) (a: A)
  → B a → (A → B a))
* (Pi_Elim: (B: A → U) (a: A)
  → (A → B a) → B a)
* (Pi_Comp1: (B: A → U) (a: A)
  (f: A → B a) → Path (B a)
  (Pi_Elim B a (Pi_Intro B a (f a))) (f a))
* (Pi_Comp2: (B: A → U) (a: A)
  (f: A → B a) →
  Path (A → B a) f (\(x:A) → f x))
* (Sigma_Former: (A → U) → U)
* (Sigma_Intro: (B: A → U) (a: A)
  → (b: B a) → Sigma A B)
* (Sigma_Elim1: (B: A → U)
  (_: Sigma A B) → A)
* (Sigma_Elim2: (B: A → U)
  (x: Sigma A B) → B (pr1 A B x))
* (Sigma_Comp1: (B: A → U) (a: A)
  (b: B a) → Path A a (Sigma_Elim1 B
    (Sigma_Intro B a b)))
* (Sigma_Comp2: (B: A → U) (a: A)
  (b: B a) → Path (B a) b
  (Sigma_Elim2 B (a,b)))
* (Sigma_Comp3: (B: A → U) (p: Sigma A B)
  → Path (Sigma A B) p
  (pr1 A B p, pr2 A B p))
* (Id_Former: A → A → U)
* (Id_Intro: (a: A) → Path A a a)
* (Id_Elim: (x: A) (C: D A)
  (d: C x x (Id_Intro x))
  (y: A) (p: Path A x y) → C x y p)
* (Id_Comp: (a:A)(C: D A)
  (d: C a a (Id_Intro a)) →
  Path (C a a (Id_Intro a)) d
  (Id_Elim a C d a (Id_Intro a))) * U

```

**Theorem 22.** (Model Check). There is an instance of MLTT.

```
instance (A: U): MLTT A
= (Pi A,      lam A, app A,
   Beta A, Eta A,
   Sigma A, dpair A, pr1 A, pr2 A,
   Beta1 A, Beta2 A, Eta2 A,
   Path A, refl A, J A,
   J_comp A, A)
```

## Cubical Model Check

The result of the work is a `|mltt.ctt|` file which can be runned using `|cubicaltt|`. Note that computation rules take a seconds to type check.

```
cubicaltt — 6 second.
Arend — 1 second.
Agda (cubical) — & 2 second.
```

## Conclusions

In this issue the type-theoretical model (interpretation) of MLTT was presented in cubical syntax and type checked in it. This is the first constructive proof of internalization of MLTT.

From the theoretical point of view the landspace of possible interpretation was shown corresponding different mathematical theories for those who are new to type theory. The brief description of the previous attempts to internalize MLTT could be found as canonical example in MLTT works, but none of them give the constructive J eliminator or its equality rule.

Type theoretical cubical constructions was given for the Path types along the article for other interpretations, all of them were taken from our Groupoid Infinity <sup>7</sup> base library.

The objective of complete derivability of all eliminators, computational and uniqueness rules is a basic objective for constructive mathematics as mathematical reasoning implies verification and mechanization. Yes cubical type system represent most compact system that make possible derivability of all theorems for core types which make this system as a first candidate for the metacircular type checker.

Also for programming purposes we may also want to investigate Fixpoint as a useful type in coinductive and modal type theories and harmful type in theoretical foundation of type systems. Elimination the possibility of uncontrolled Fixpoint is a main objective of the correct type system for reasoning without paradoxes. By this creatiria we could filter all the fixpoint implementations being condidered harmful.

---

<sup>7</sup><https://groupoid.space/>

Табл. 2: \*

Table. Core Features

Lang	$\Pi$	$\Sigma$	$\equiv$	Path	$U^\infty$	Co/Fix	Lazy
PTS	x						
Cedile, MLTT	x	x	x				
Henk	x				x		
Per	x	x		x	x		
Lean, Agda	x		x	x	x		
NuPRL	x	x	x			x	
System-D	x	x				x	x
cubicaltt	x	x	x	x		x	

Without a doubt the core type that makes type theory more like programming is the inductive type system that allows to define type families. In the following Issue II will be shown the semantics and embedding of inductive types with several types of Inductive-Recursive encodings.

Табл. 3: \*

Table. Inductive Type Systems

Lang	Co/Inductive	Quot/Trunc	HITs
System-D	x		
Lean	x	x	
NuPRL	x	x	
Arend	x	x	x
Agda, Coq	x		x
cubicaltt, yacctl, RedPRL	x		x

Further research of the most pure type theory on a weak fibrations and pure Kan operations without interval lattice structure (connections, de Morgan algebra, connection algebras) and diagonal coersions could be made on the way of building a minimal homotopy core [1].

The next language after  $PTS^\infty$  and  $MLTT^\infty$  will be  $HTS^\infty$  with recursive higher inductive type system and infinite number of universes. Along with O-CPS interpreter this evaluators form a set of languages as a part of conceptual model of theorem proving system with formalized virtual machine as extraction target.

## Further Research

This article opens the door to a series that will unveil the different topics of homotopy type theory with practical emphasis to cubical type checkers.

Табл. 4: \*

Table. Cubical Type Systems

Lang	Interval	Diagonal	Kan/Coe
BCH, cubical			$0 \rightarrow r, 1 \rightarrow r$
CCHM, cubicaltt, Agda	$\vee, \wedge$		$0 \rightarrow 1$
Dedekind	$\vee, \wedge$		$0 \rightarrow 1, 1 \rightarrow 0$
AFH/ABCFHL, yacett		x	$r \rightarrow s$
HTS/CMS			$r \rightarrow s, \text{weak}$

The Foundations volume of articles define formal programming language with geometric foundations and show how to prove properties of such constructions. The second volume of article is dedicated to cover the programming and modeling of Mathematics.

**Issue I: Type Theory.** The first volume of definitions gathered into one article dedicated to various  $\prod$  and  $\sum$  properties and internalization of MLTT in the host language typechecker.

**Issue II: Inductive Types.** This episode tales a story of inductive types, their encodings, induction principle and its models.

**Issue III: Homotopy Type Theory.** This issue is try to present the Homotopy Type Theory without higher inductive types to neglect the core and principles of homotopical proofs.

**Issue IV: Higher Inductive Types.** The metamodel of HIT is a theory of CW-complexes. The category of HIT is a homotopy category. This volume finalizes the building of the computational theory.

**Issue V: Modalities.** The constructive extensions with additional context and adjoint transports between toposes (cohesive toposes). This approach serves the needs of modal logics, differential geometry, cohomology.

The main intention of Foundation volume is to show the internal language of working topos of CW-complexes, the construction of fibrational sheaf type theory.

**Проблематика.** Був пройдений довгий шлях від чистих типових систем AUTOMATH де Брейна до гомотопічних типових верифікаторів. Ця стаття стосується тільки формального ядра теорії типів Мартіна-Льофа:  $\Pi$  и  $\Sigma$  типів (які відповідають квантору загальності  $\forall$  та квантору існування  $\exists$  у класичній логіці) та типу-рівності.

**Мета дослідження.** Визначити типову систему як частину моделі системи доведення теорем, у якій конструктивно виражається  $J$  елімінатор та його теореми, спираючись на більш абстрактні примітиви типу рівності. Це стало можливим завдяки кубічній теорії типів (2016) та типовому кубічному верифікатору `cubicaltt`<sup>8</sup> (2017). Ціль статті — продемонструвати формальне вбудовування теорії типів Мартіна-Льофа в виконуючу авторську кубічну типову систему **Per** з повним набором правил виводу.

**Методика реалізації.** Так як всі типи в теорії формулюються за допомогою п'яти правил: формації, інтро, елімінації, обчислення, рівності) що в сутності є кодуванням ізоморфізмами ініціальних об'єктів в категорія  $F$ -алгебр, ми зконструювали номінальні типи-синоніми для виконуючого верифікатора та довели, що це є реалізацією MLTT. Так як не всі можуть бути знайомі з теорією типів, це випуск також містить їх інтерпретації з точки зору різних розділів математики.

**Результати дослідження.** Ця робота веде до декількох результатів: 1) **Per** — спеціальна версія теорії типів Мартіна-Льофа зі зліченною кількістю всесвітів та Path типом без  $\eta$ -правила для HoTT застосування у яку ми будемо вбудовувати класичну MLTT; 2) Інтерналізація MLTT в **Per** з синтаксисом який дозволяє виводити поліморфні всесвіти; 3) Класифіковані різні інтерпретації цієї системи типів: теоретико-типова, категорна або топосо-теоретична, гомотопічна або кубічна; 4) Це може розглядатися як універсальний тест для імплементації типового верифікатора, позаяк компенсація інтро правила та правила елімінатора пов'язані в правилі обчислення та рівності (бета та  $\eta$  редукціях). Таким чином, доводжучи реалізацію MLTT, ми доводимо властивості виконуючого верифікатора; 6) Завдяки позитивним результатам кубічна теорія була вибрана як геометричне розширення системи індуктивних типів для математичної верифікації як частина концептуальної системи доведення теорем, яка включатиме серію мов як середовище верифікації.

**Висновки.** Додамо, що це тільки вхід в техніку прямого вбудовування і після MLTT моделювання, ми можемо піднятися вище — до вбудовування в систему індуктивних типів, і далі, до вбудовування CW-комплексів як злеюнок вищих індуктивних типів, та далі до модальних логік. Це означає широкий спектр математичних теорій всередині HoTT аж до алегбраїчної топології.

**Ключові слова:** Теорія типів Мартіна-Льофа, Кубічна теорія типів.
