1 Inductive Encodings

1.1 Church Encoding

You know Church encoding which also has its dependent analogue in CoC, however in Coq it is impossible to derive Inductive Principle as type system lacks fixpoint and functional extensionality. The example of working compiler of PTS languages are Om and Morte. Assume we have Church encoded NAT:

$\text{nat} = (X:U) \rightarrow (X \rightarrow X) \rightarrow X \rightarrow X$

where first parameter $(X \rightarrow X)$ is a *succ*, the second parameter X is *zero*, and the result of encoding is landed in X . Even if we encode the parameter

$\text{list } (A: U) = (X:U) \rightarrow X \rightarrow (A \rightarrow X) \rightarrow X$

and parameter A let's say live in 42 universe and X live in 2 universe, then by the signature of encoding the term will be landed in X , thus 2 universe. In other words such dependency is called impredicative displaying that landed term is not a predicate over parameters. This means that Church encoding is incompatible with predicative type checkers with predicative of predicative-cumulative hierarchies.

1.2 Scott Encoding

1.3 Parigot Encoding

1.4 CPS Encoding

1.5 Interaction Networks Encoding

1.6 Impredicative Encoding

In HoTT n -types is encoded as n -groupoids, thus we need to add a predicate in which n -type we would like to land the encoding:

$\text{NAT } (A: U) = (X:U) \rightarrow \text{isSet } X \rightarrow X \rightarrow (A \rightarrow X) \rightarrow X$

Here we added *isSet* predicate. With this motto we can implement propositional truncation by landing term in *isProp* or even HIT by landing in *isGroupoid*:

$\text{TRUN } (A:U) \text{ type} = (X: U) \rightarrow \text{isProp } X \rightarrow (A \rightarrow X) \rightarrow X$
 $\text{S1} = (X:U) \rightarrow \text{isGroupoid } X \rightarrow ((x:X) \rightarrow \text{Path } X \ x \ x) \rightarrow X$
 $\text{MONOPL} (A:U) = (X:U) \rightarrow \text{isSet } X \rightarrow (A \rightarrow X) \rightarrow X$
 $\text{NAT} = (X:U) \rightarrow \text{isSet } X \rightarrow X \rightarrow (A \rightarrow X) \rightarrow X$

The main publication on this topic could be found at [11] and [10].

The Unit Example

Here we have the implementation of Unit impredicative encoding in HoTT.

```

upPath      (X Y:U) (f:X→Y) (a:X→X): X → Y = o X X Y f a
downPath    (X Y:U) (f:X→Y) (b:Y→Y): X → Y = o X Y Y b f
naturality  (X Y:U) (f:X→Y) (a:X→X) (b:Y→Y): U
  = Path (X→Y) (upPath X Y f a) (downPath X Y f b)

unitEnc': U = (X: U) → isSet X → X → X
isUnitEnc (one: unitEnc'): U
  = (X Y:U) (x: isSet X) (y: isSet Y) (f:X→Y) →
    naturality X Y f (one X x) (one Y y)

unitEnc: U = (x: unitEnc') * isUnitEnc x
unitEncStar: unitEnc = (\(X:U) (\_ : isSet X) →
  idfun X, \ (X Y: U) (\_ : isSet X) (\_ : isSet Y) → refl (X→Y))
unitEncRec  (C: U) (s: isSet C) (c: C): unitEnc → C
  = \ (z: unitEnc) → z.1 C s c
unitEncBeta (C: U) (s: isSet C) (c: C)
  : Path C (unitEncRec C s c unitEncStar) c = refl C c
unitEncEta  (z: unitEnc): Path unitEnc unitEncStar z = undefined
unitEncInd  (P: unitEnc → U) (a: unitEnc): P unitEncStar → P a
  = subst unitEnc P unitEncStar a (unitEncEta a)
unitEncCondition (n: unitEnc'): isProp (isUnitEnc n)
  = \ (f g: isUnitEnc n) →
    <h> \ (x y: U) → \ (X: isSet x) → \ (Y: isSet y)
    → \ (F: x → y) → <i> \ (R: x → Y (F (n x X R))) (n y Y (F R))
    (<j> f x y X Y F @ j R) (<j> g x y X Y F @ j R) @ h @ i

```

1.7 Lambek Encoding: Homotopy Initial Algebras

2 Inductive Types

2.1 W

Well-founded trees without mutual recursion represented as W-types.

Definition 1. (W-Formation). For $A : \mathcal{U}$ and $B : A \rightarrow \mathcal{U}$, type W is defined as $W(A, B) : \mathcal{U}$ or

$$W_{(x:A)}B(x) : \mathcal{U}.$$

$\text{def } W \ (A : \mathcal{U}) \ (B : A \rightarrow \mathcal{U}) : \mathcal{U} := W \ (x : A), B \ x$

Definition 2. (W-Introduction). Elements of $W_{(x:A)}B(x)$ are called well-founded trees and created with single sup constructor:

$$\text{sup} : W_{(x:A)}B(x).$$

$\text{def } \text{sup}\$ '\$ \ (A : \mathcal{U}) \ (B : A \rightarrow \mathcal{U}) \ (x : A) \ (f : B \ x \rightarrow W^* \ A \ B)$
 $\quad : W^* \ A \ B$
 $\quad := \text{sup} \ A \ B \ x \ f$

Theorem 1. (Induction Principle ind_W). The induction principle states that for any types $A : \mathcal{U}$ and $B : A \rightarrow \mathcal{U}$ and type family C over $W(A, B)$ and the function $g : G$, where

$$G = \prod_{x:A} \prod_{f:B(x) \rightarrow W(A,B)} \prod_{b:B(x)} C(f(b)) \rightarrow C(\text{sup}(x, f))$$

there is a dependent function:

$$\text{ind}_W : \prod_{C:W(A,B) \rightarrow \mathcal{U}} \prod_{g:G} \prod_{a:A} \prod_{f:B(a) \rightarrow W(A,B)} \prod_{b:B(a)} C(f(b)).$$

$\text{def } W\text{-ind} \ (A : \mathcal{U}) \ (B : A \rightarrow \mathcal{U})$
 $\quad (C : (W \ (x : A), B \ x) \rightarrow \mathcal{U})$
 $\quad (g : \prod_{(x : A)} (f : B \ x \rightarrow (W \ (x : A), B \ x)) \rightarrow C \ (\text{sup} \ A \ B \ x \ f))$
 $\quad (\prod_{(b : B \ x)} C \ (f \ b)) \rightarrow C \ (\text{sup} \ A \ B \ x \ f))$
 $\quad (a : A) \ (f : B \ a \rightarrow (W \ (x : A), B \ x)) \ (b : B \ a)$
 $\quad : C \ (f \ b) := \text{ind}^W \ A \ B \ C \ g \ (f \ b)$

Theorem 2. (ind_W Computes). The induction principle ind^W satisfies the equation:

$$\text{ind}_W\text{-}\beta : g(a, f, \lambda b. \text{ind}^W(g, f(b))) \\ =_{\text{def}} \text{ind}_W(g, \text{sup}(a, f)).$$

$\text{def } \text{ind}^{W-\beta} \ (A : \mathcal{U}) \ (B : A \rightarrow \mathcal{U})$
 $\quad (C : (W \ (x : A), B \ x) \rightarrow \mathcal{U}) \ (g : \prod_{(x : A)}$
 $\quad \quad (f : B \ x \rightarrow (W \ (x : A), B \ x)), (\prod_{(b : B \ x)} C \ (f \ b)) \rightarrow C \ (\text{sup} \ A \ B \ x \ f))$
 $\quad \quad (a : A) \ (f : B \ a \rightarrow (W \ (x : A), B \ x))$
 $\quad : \text{PathP} \ (<_> \ C \ (\text{sup} \ A \ B \ a \ f))$
 $\quad \quad (\text{ind}^W \ A \ B \ C \ g \ (\text{sup} \ A \ B \ a \ f))$
 $\quad \quad (g \ a \ f \ (\lambda (b : B \ a), \text{ind}^W \ A \ B \ C \ g \ (f \ b))))$
 $\quad := <_> \ g \ a \ f \ (\lambda (b : B \ a), \text{ind}^W \ A \ B \ C \ g \ (f \ b))$

2.2 M

2.3 Empty

The Empty type represents False-type logical $\mathbf{0}$, type without inhabitants, void or \perp (Bottom). As it has not inhabitants it lacks both constructors and eliminators, however, it has induction.

Definition 3. (Formation). Empty-type is defined as built-in $\mathbf{0}$ -type:

$$\mathbf{0} : \mathcal{U}.$$

Theorem 3. (Induction Principle ind_0). $\mathbf{0}$ -type is satisfying the induction principle:

$$\text{ind}_0 : \prod_{C : \mathbf{0} \rightarrow \mathcal{U}} \prod_{z : \mathbf{0}} C(z).$$

`def Empty-ind (C: $\mathbf{0} \rightarrow \mathcal{U}$) (z: $\mathbf{0}$) : C z := ind0 (C z) z`

Definition 4. (Negation or isEmpty). For any type A negation of A is defined as arrow from A to $\mathbf{0}$:

$$\neg A := A \rightarrow \mathbf{0}.$$

`def isEmpty (A: \mathcal{U}): \mathcal{U} := A $\rightarrow \mathbf{0}$`

The witness of $\neg A$ is obtained by assuming A and deriving a contradiction. This techniques is called proof of negation and is applicable to any types in constrast to proof by contradiction which implies $\neg\neg A \rightarrow A$ (double negation elimination) and is applicable only to decidable types with $\neg A + A$ property.

2.4 Unit

Unit type is the simplest type equipped with full set of MLTT inference rules. It contains single inhabitant \star (star).

- 2.5 Bool
- 2.6 Maybe
- 2.7 Either
- 2.8 Nat
- 2.9 List
- 2.10 Vector
- 2.11 Stream
